Each zinc finger can recognise a subsite of C3 bp in target DNA. Covalent linkage of multiple zinc finger domains CC allows the recognition of extended contiguous asymmetric DNA sequences. For example, a synthetic polydactyl protein containing six zinc finger CC domains can recognise an 18 bp sequence, and such proteins are CC potentially highly gene-specific. The novel nucleotide-binding zinc CC finger proteins may therefore be used in the development of artificial CC gene-specific transcriptional regulators. Such transcriptional switches CC may be used to regulate the expression of oncogenes such as erbB-2, CC overexpression of which is involved in malignant transformation. The CC proteins are therefore useful in the treatment of cancers, and may also be used to activate genes involved in fighting diseases, and to treat CC viral infections by inhibiting the synthesis of viral gene products. They be used in DNA-based diagnostic applications. The proteins may also be used in DNA-based diagnostic applications. The proteins may also be used in producing functional gene knockout or activation in CC discriminate between sequences which have a single base difference. This is mainfested in a -100-fold decrease in affinity for the variant CC within the gene transcript, suggesting that information obtained from CC expressed sequences AAB02876-B02869 represent zinc finger alpha helix CC phage library peptides disclosed in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                        The invention comprises a library of multimeric DNA binding polypeptides (e.g. zinc finger DNA binding polypeptides). The zinc finger binding polypeptides of the invention are useful for sterically occluding the binding site of a natural transcription factor and enhancing or silencing target gene expression. The present amino acid sequence represents a zinc finger DNA binding peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an expression of nucleotide sequence that contains sequence 5' (GNN)n-3', in which n is 1-6, is regulated by exposing nucleotide sequence to composition comprising isolated and purified zinc finger-nucleotide binding polypeptide that contains a nucleotide binding region having a sequence of Gly-Cys-Arg-Glu-Leu-Val-Arg. The invention is used in the regulation of the expression of the nucleotide sequence that contains sequence 5'-(GNN)n-3'. The present sequence represents the amino acid sequence of a zinc finger binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                               New zinc finger library of multimeric DNA binding polypeptides, useful for sterically occluding the binding site of a natural transcription factor, and enhancing or silencing target gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          library; multimeric DNA binding polypeptide; zinc finger DNA binding peptide; gene expression gene expression enhancement.

The invention relates to zinc finger nucleotide-binding proteins which comprise 2-12, preferably 2-6, operatively linked motifs selected from sequences AAB02860-B02875. Sequences AAB02860-B02875 represent the alpha helical regions of zinc finger domains which specifically bind to target nucleotide triplets of the sequence 5'-GNN-3'. Such regions may be linked by the peptide linker TGEKP (AAB02970). The Cys2-His2 zinc finger motif is the most frequently utilised nucleic acid binding motif in eukaryotes, and constitutes a beta-beta-alpha fold. Nucleic acid recognition is

Novel isolated and purified zinc finger nucleotide-binding proteins with specificity for GNN triplet sequences, useful in gene therapy and for regulating gene function.

WPI; 2000-339648/29.

Nature 417:459-463(2002).
-!- FUNCTION: Call wall formation.
-!- CATALYTIC ACTIVITY: ATP + UDP-N-acetylmuramate + L-alanine = ADP + phosphate + UDP-N-acetylmuramyl-L-alanine.
-!- PATHWAY: Peptidoglycan biosynthesis.
-!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
-!- SIMILARITY: Belongs to the murCDEF family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        entities requires a license agreement (See http://www.isb-sib.ch/announce, or send an email to license@isb-sib.ch).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention relates to zinc finger nucleotide-binding proteins which comprise 2-12, preferably 2-6, operatively linked motifs selected from Sequences AB02860-B02875, Sequences AB028075 perpresent the alpha control to the sequence 5 cannot september the alpha control triplets of the sequence 5 cannot specifically bind to target to by the peptide linker TGERF (AB02970). The Cys-His2 zinc finger motif is the most frequently utilised nucleic acid binding motif in eukaryotes, can decorate from side chains of amino acid cachieved through specific contacts from side chains of amino acid cachieved through specific contacts from side chains of amino acid cachieved through specific contacts from side chains of amino acid cachieved through specific contacts from side chains of amino acid cachieved through specific contacts from side chains of amino acid cachieved through specific contacts from side chains of amino acid cachieved through specific contacts from side chains of amino acid cachieved through specific perposed of multiple zinc finger domains can recognition of extended contiguous asymmetric DNA sequences. Cachieved through specific perposes and such proteins are chains of amino acid cachieves and such proteins are charactiptional regulators. Such transcriptional switches the potentially highly gene-specific. The novel nucleotide-binding zinc cachieves are therefore useful in the treatment of cancers, and may also be used to activate genes involved in malignant transformation. The proteins are therefore useful in the treatment of cancers, and may also be used in producing functional gene knockout or activation in heterozygous transgratic animals. Proteins of the invention can because of the sequence tags may be sufficient for the variant sequence tags may be sufficient for the construction of gene captivations and repression can be achieved by targetting from the supersent zinc finger alpha helix captions of the construction of gene spressent since of the construction of gene spressent since of the construction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Fig 1; 48pp; English

The invention relates to an expression of nucleotide sequence that contains sequence 5'-(GNN)n-3', in which n is 1-6, is regulated by exposing nucleotide sequence to composition comprising isolated and purified zinc finger-nucleotide binding polypeptide that contains a nucleotide binding region having a sequence of Gly-Cys-Arg-Glu-Leu-Val-Arg. The invention is used in the regulation of the expression of the nucleotide sequence that contains sequence 5'-(GNN)n-3'. The present sequence represents the amino acid sequence of a zinc finger binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Regulating expression of nucleotide sequence that contains sequence (GNN)n-3', comprises exposing nucleotide sequence to composition comprising isolated and purified zinc finger-nucleotide binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; SEQ ID NO 36; 46pp; English.

AAA65890 to AAA66055 and AAB15886 to AAB16040 represent nucleotide and protein sequences associated with E. coli proliferation. AAA66057 represent primers used for sequencing E. coli proliferation inhibiting nucleotide inserts in an example from the present invention. Methods from the present invention can be used to identify a proliferation-required gene in a microorganism, by contacting a microorganism with a proliferation-required gene activity inhibitory nucleic acid identified in another organism, and determining if inhibition occurs in the second microorganism. The nucleic acid sequences identified as being required for bacterial growth and proliferation, can
                          the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated
                                                                                                                                                                                                                                                          Claim 25;
                                                                                                                                                                                                                                                                                                                  New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   N-PSDB;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    21-MAR-2001; 2001US-00815242.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to provide a few produces of the traits to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 973 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this acid sequences of the invention of the sequence data for this acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutation responsible for genetic disorders or other traits and to assess
Escherichia coli; 0157:H7

Novel polynucleotides and polypeptides associated with microorganism proliferation, used to identify inhibitors of bacterial growth and proliferation, for use in antisense therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel enterohaemorragic Escherichia coli 0157:H7-specific nucleic acid molecule. A polynucleotide of the invent has anti-bacterial activity. The polypetide can be used in detection and/or treatment of 0157:H7 infection. The nucleotide sequence of the genome of Enterohaemorragic E coli 0157:H7 was determined. The present sequence represents an E. coli 0157:H7-specific polypeptide of the
                                                                                                                   Zyskind J, Ohlsen KL, Carr GJ, Yamamoto RT,
                                                                                                                                                                                                                                                                                                                                                                         Escherichia coli; E. antimicrobial; bacter

                                                                                                                                                                                                                                                                Ś
                                                                                                                                                                                                                                                                                                                                                                                      CC the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a prometer operably linked to the nucleic acid cell. Also included are: (2) a vector comprising a prometer operably linked to the nucleic acid cencing a polypeptide whose expression is inhibited by the antisense comprisite acid; (4) an antibody capable of specifically binding cell-polypeptide; (5) producing the vector; (3) an isolated continued antisense comprisite acid; (4) an antibody capable of specifically binding cell-polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway certains of the proliferation, or that inhibits cellular proliferation; (8) centifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies compound acts; (9) manufacturing an antibiotic proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound activity of the strains is present in a culture or collection of an organism acts; (9) identifying the target of a compound that inhibits the gene product is overexpressed or underexpressed; (12) determining the extent compound that inhibits proliferation of an organism. The antisense nucleic acids are useful for cellular proliferation to isolate candidate molecules for rational certains; or (13) identifying the target of a compound that inhibits the gene certains; or collection of solate candidate molecules for rational certains in cells other than S. aureus, S. typhimurium, C. R. preumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this centared for part of the printed specification, but was obtained in electronic format directly from MIPO at

Novel human diagnostic protein #15788.

밁 S

0

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) C sequences. (I) is useful as hybridisation probes, polymerase chain C reaction (PCR) primers, oligomers, and for chromosome and gene mapping, CC and in recombinant production of (II). The polynucleotides are also used C in diagnostics as expressed sequence tags for identifying expressed used C genes. (I) is useful in gene therapy techniques to restore normal CC useful for generating antibodies against it, detecting or quantitating a C polypeptide in tissue, as molecular weight markers and as a food CC supplement. (II) and its binding partners are useful in medical imaging CC involving aberrant protein expression or biological activity. The CC involving aberrant protein expression or biological activity. The CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity CC and to produce other types of data and products dependent on DNA and CC amino acid sequences ABG00010-ABG30377 represent novel human diagnostic C attomic of agent in the printed specification, but was obtained in CC electronic format directly from WIPO at CC ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                   Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ફ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ARR99314 is a rat MIPTP (protein tyrosine phosphatase-1) clone. A cDNA clone encoding this sequence was used as a probe to isolate a series of overlapping human cDNA clones defining the human MIPTP equivalent, SH-PTP1, which contains two tandem SH2 domains. A sequence complementary to nucleotides 537-653 of the SH-PTP1 gene clone given as ART35306 is used as a probe to detect a chromosome 12p13 abnormality associated with neoplastic disease, in partic. acute lymphoblastic leukaemia. The probe with seven as patient sample it is indicative of an abnormality. Cormality associated with neoplasia. Fragments of sequences encoding human SH-PTP2 (see ART35307) may also be used to disgnose a condition or susceptiblity to a condition associated with chromosome 12 gane to a condition associated with chromosome 12 gane or protein may be used for comparison to sequenced PTP genes taken from a patient, where purposely altered by mutation to effect a change in megakaryocyte function and hence platelet production.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method for identifying a protein tyrosine CC phosphatase (PTP) that is reversibly oxidized in a cell by: (i) CC subjecting a sample, including a cell that contains at least one PTP, to CC conditions that cause reversible oxidation of PTP; (ii) isolating PTP CC conditions that cause reversible oxidation of PTP; (ii) isolating PTP CC conditions that cause reversible oxidation of PTP; (ii) isolating PTP CC conditions that cause reversible oxidation of PTP; (ii) isolating PTP CC conditions, the level of the conditions, the level of the conditions, the level of terms of PTP; and (iii) determining, under reducing conditions, the level conditions of PTP; also to identify PTP is present. No details CC dephosphorylation indicates that an active PTP is present. No details CC of tests for these activities are given. The method is used to identify reversibly oxidized PTP, also to identify agents that: (a) reversibly CC modify such PTP; or (b) alter inducible signalling pathways in which PTP CC are involved. These agents are potentially useful, in human or veterinary CC medicine, for treating abnormal cell proliferation or growth (cancer); constitutes that the properties of the propert
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

The primer given in AAQ67682 is used in the amplification of MPTP-H3/180 (given in AAR56994). (Updated on 25-MAR-2003 to correct PN

(protein tyrosine

phosphatase-1) clone

(revised)
(first entry)

PTP; protein tyrosine phosphatase; SH2; Src homology region 2; chromosome 12p; abnormality; mutation; detection; probe; neoplasia; cancer; leukaemia; diagnosis; megakaryocyte regulation.

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) CS sequences. (I) is useful as hybridisation probes, polymerase chain CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping, CC and in recombinant production of (II). The polynucleotides are also used CC in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal CC useful for generating antibodies against it, detecting or quantitating a CC useful for generating antibodies against it, detecting or quantitating a CC useful for generating antibodies against it, detecting or quantitating a CC useful for generating antibodies against it, detecting or quantitating a CC involving aberrant protein as molecular weight markers and as a food CC supplement. (II) and its binding partners are useful in medical imaging CC involving aberrant protein expression or biological activity. The CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity CC and to produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic CC amino acid sequences of the invention. Note: The sequence data for this cateronic format directly from WIPO at CC fit, wipo.int/pub/published_pct_sequences

The novel nucleotide-binding zinc finger proteins may therefore be used in the development of artificial CC gene-specific transcriptional regulators. Such transcriptional switches CC may be used to regulate the expression of oncogenes such as erbb-2. CC overexpression of which is involved in malignant transformation. The CC proteins are therefore useful in the treatment of cancers, and may also be used to activate genes involved in fighting diseases, and to treat crival infections by inhibiting the synthesis of viral gene products. They can be used in DNA-based diagnostic applications. The proteins may also be used in producing functional gene knockout or activation in CC heterozygous transgenic animals. Proteins of the invention can CC is manifested in a >100-fold decrease in affinity for the variant complete the gene activation and repression can be achieved by targetting CC within the gene transcript, suggesting that information obtained from CC expressed sequences AAB02876-B02889 represent zinc finger alpha helix company peptides disclosed in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                               The invention comprises a library of multimeric DNA binding polypeptides (e.g. zinc finger DNA binding polypeptides). The zinc finger binding polypeptides of the invention are useful for sterically occluding the binding site of a natural transcription factor and enhancing or silencing target gene expression. The present amino acid sequence represents a zinc finger DNA binding peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   library; multimeric

The invention relates to zinc finger nucleotide-binding proteins which comprise 2-12, preferably 2-6, operatively linked motifs selected from sequences AAB02860-B02875. Sequences AAB02860-B02875 represent the alpha helical regions of zinc finger domains which specifically bind to target nucleotide triplets of the sequence 5'-GNN-3'. Such regions may be linked by the peptide linker TGEKP (AAB02970). The Cys2-His2 zinc finger motif is the most frequently utilised nucleic acid binding motif in eukaryotes, and constitutes a beta-beta-alpha fold. Nucleic acid recognition is

Novel isolated and purified zinc finger nucleotide-binding proteins with specificity for GNN triplet sequences, useful in gene therapy and for

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
